Architecture Audit Report

FinSight Enterprise Architecture Audit

1. Codebase Cleansing

- Scanned all dashboard/pages/ against ■pp.py router.

- Identified and removed dead code: prediction.py and ml_models.py.

- Verified no circular imports exist across src/ modules.

2. Database & State Integration

- SQLAlchemy PostgreSQL models successfully implemented across all tables (Users, Customers, Predictions, etc.).

- Streamlit session state integrated to persist authentication and applicant contexts.

3. Data Pipeline Verification

- All mock data generators removed.

- Dashboards now query directly from data/processed/application_train_segmented.csv and live SQLite/PostgreSQL tables.

Status: Production Ready
